(57)Abstract:

PROBLEM TO BE SOLVED: To confirm the result of the composition processing of an image by the exposure of a silver salt film and a composed image, in photographing.
SOLUTION: An electron image almost equivalent to an object's image obtained by the exposure is fetched by an image pickup element 8, in accordance with the operation of exposing the silver salt film 15 and stored in a memory element in an image processing circuit 10. When a photographer selects one of plural composed images previously stored in a memory 12, the electron image and the selected composed image are composed and displayed on a monitor 11. The composed image selected by the photographer or information corresponding to this composed image is recorded in a magnetic recording part 15a on the film 15, when it is rewound.

CLAIMS

[Claim(s)]

[Claim 1] A storage means to memorize an electronic image almost equivalent to the photographic subject image exposed on the above-mentioned silver halide film with the exposure actuation to the above-mentioned silver halide film in the camera which can be loaded with the silver halide film which has the information Records Department, A selection means to choose the image which should be compounded in the photographic subject image exposed on the above-mentioned silver halide film, The camera characterized by to provide a display means to compound the electronic image read from the above-mentioned storage means, and the image for composition by which selection was made [above-mentioned], and to display on a monitoring device, and a record means to record the information about the image for composition by which selection was made [above-mentioned] on the above-mentioned information Records Department.

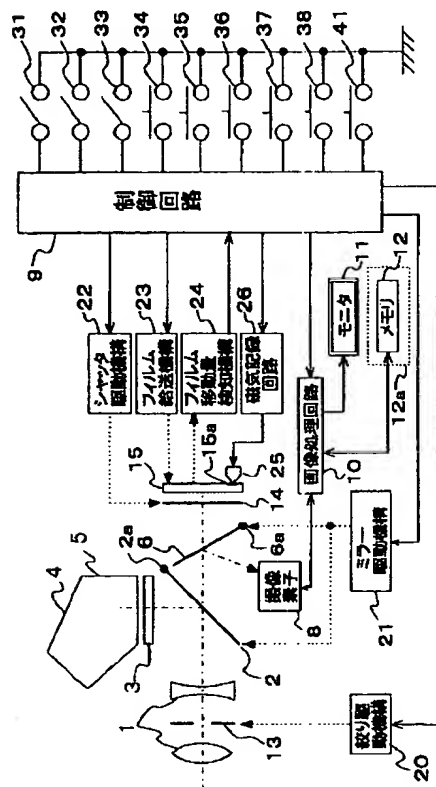

[Claim 2] The above-mentioned record means is a camera according to claim 1 characterized by recording the information about the above-mentioned image for composition on the magnetic-recording section for every photography piece in case the above-mentioned silver halide film is rewound.

[Claim 3] A storage means to memorize an electronic image almost equivalent to the photographic subject image exposed on the silver halide film in the camera which has a monitoring device synchronizing with the exposure to a silver halide film, and when a photography person wants An electronic image display means to display the electronic image by which storage was carried out [above-mentioned] on the above-mentioned monitoring device, An image composition means to compound at least one of two or more of the image data for composition prepared beforehand in the above-mentioned electronic image, and to display on the above-mentioned monitoring device while looking at the image by which an indication was given [above-mentioned], The camera by which it is providing-record means to record above-mentioned image data for composition, or information corresponding to it on the information Records Department of above-mentioned silver halide film characterized.

[Claim 4] It synchronizes with the exposure to the above-mentioned silver halide film in the camera which can be loaded with the silver halide film which has the information Records Department. An electronic image taking-in means to capture an electronic image almost equivalent to the photographic subject image exposed on the above-mentioned silver halide film, A selection means to choose the image compounded in this image for appreciation in case the image for appreciation is generated based on the photographic subject image exposed by the above-mentioned silver halide film out of two or more images for composition prepared beforehand, The camera characterized by providing the synthetic means which carries out synthetic processing of the image for composition by which selection was made [above-mentioned], and the above-mentioned electronic image, and a monitor means to display the electronic image by which synthetic processing was carried out with the above-mentioned synthetic means.
